How do we understand the world? While some look to the heavens for intelligent design, others argue that it is determined by information encoded in DNA. Science serves as an important activity for uncovering the processes and operations of nature, but it is also immersed in a social context where ideology influences the questions we ask and how we approach the material world. Influence: Dialectical Essays on the Coevolution of Nature and Society breaks from the confines of determinism, offering a dialectical analysis for comprehending a dynamic social and natural world. In *Biology Under the Influence*, Richard Lewontin and Richard Levins provide a devastating critique of genetic determinism and reductionism within science while exploring a broad range of issues including the nature of science, biology, evolution, the environment, public health, and dialectics. They dismantle the ideology that attempts to naturalize social inequalities, unveil the alienation of science and nature, and illustrate how a dialectical position serves as a

basis for grappling with historical developments and a world characterized by change. *Biology Under the Influence* brings together the illuminating essays of two prominent scientists who work to demystify and empower the public's understanding of science and nature.

Is our nature—as individuals, as a species—determined by our evolution and encoded in our genes? If we unravel the protein sequences of our DNA, will we gain the power to cure all of our physiological and psychological afflictions and even to solve the problems of our society? Today biologists—especially geneticists—are proposing answers to questions that have long been

asked by philosophy or faith or the social sciences. Their work carries the weight of scientific authority and attracts widespread public attention, but it is often based on what the renowned evolutionary biologist Richard Lewontin identifies as a highly reductive misconception: "the pervasive error that confuses the genetic state of an organism with its total physical and psychic nature as a human being." In these nine essays covering the history of modern biology from Darwin to Dolly the sheep, all of which were originally published in *The New York Review of Books*, Lewontin combines sharp criticisms of overreaching scientific claims with lucid expositions of the exact state of current scientific knowledge—not

only what we do know, but what we don't and maybe won't anytime soon. Among the subjects he discusses are heredity and natural selection, evolutionary psychology and altruism, nineteenth-century naturalist novels, sex surveys, cloning, and the Human Genome Project. In each case he casts an ever-vigilant and deflationary eye on the temptation to look to biology for explanations of everything we want to know about our physical, mental, and social lives. These essays—several of them updated with epilogues that take account of scientific developments since they were first written—are an indispensable guide to the most controversial issues in the life sciences today. The second edition of this

collection includes new essays on genetically modified food and the completion of the Human Genome Project. It is an indispensable guide to the most controversial issues in the life sciences today.

This book, the latest in the continuing debate between the genetic reductionists (such as Richard Dawkins, John Maynard Smith and E.O. Wilson) and those who argue for a rather more complex relationship between genes and the environment (such as Stephen Jay Gould, Steven Rose and Niles Eldredge). Lewontin is a forceful writer and this is an effective statement of the case against the selfish gene.

experiencing a baby boom. Advances in gay rights coupled with increased availability of alternative reproduction techniques have led to an unprecedented number of openly gay and lesbian parents. Estimates are that between 6 and 14 million children in the United States are being raised by at least one parent who is gay. Yet, very little is known about how gay or lesbian headed families function, or whether they differ in any relevant ways from families headed by straight parents. Written by two developmental psychologists, *The Gay Baby Boom* reports the findings of *The Gay and Lesbian Family Study*, the largest national assessment of gay and lesbian headed families. By asking

Participants detailed questions about the way they parent, the authors are able to describe for the first time exactly what takes place within gay and lesbian headed families across the county. Traditional research has tended to assume that there is something uniquely different and potentially psychologically damaging about children being raised by gays. The authors draw on their data to show these fears unfounded.

A brilliant inquiry into the origins of human nature from the author of *The Better Angels of Our Nature* and *Enlightenment Now*.

"Sweeping, erudite, sharply argued, and fun to read..also highly persuasive." --Time Now updated with a new afterword One of the world's leading experts on language and the mind explores the idea of human nature and its moral, emotional, and political colorings. With characteristic wit, lucidity, and insight, Pinker argues that the dogma that the mind has no innate traits-a doctrine held by many intellectuals during the past century-denies our common humanity and our individual preferences, replaces objective

analyses of social problems with feel-good slogans, and distorts our understanding of politics, violence, parenting, and the arts. Injecting calm and rationality into debates that are notorious for ax-grinding and mud-slinging, Pinker shows the importance of an honest acknowledgment of human nature based on science and common sense.
