Gas Turbine Engine

Gas Turbine Engine

The gas turbine is an internal-combustion engine employing a gas as the working fluid used to drive a turbine. The first step is to combust air and fuel to produce a high-temperature, high-pressure gas that drives the turbine. This gas is then passed through the gas turbine stages, where it drives the blades of the turbine to generate power. The gas turbine engine is a type of internal combustion engine used to produce power for various applications, including industrial, military, and aerospace. It is characterized by its high efficiency and ability to operate on a wide range of fuels.
