Chapter 36: Optical Applications. In this chapter we study geometrical optics as applied to real systems. A basic understanding of ideas from previous chapters, such as lens operation is, of course, assumed. Applications covered include the eye, camera, microscope, telescope, and laser cavities.

Optical properties of polybenzoxazines are poorly studied areas despite offering interesting potential. The polybenzoxazine derived from tert-butyl amine has been reported to exhibit photoconductivity [400, 401]. Such a property can be used for storage media. Figure 36 shows the photocurrent action spectrum. This spectrum is reversible and the photocurrent is highly dependent on the electric field strength which suggests that the phenomenon is not an electrochemical origin.

Figure 36 shows the photocurrent action spectrum. This spectrum is reversible and the photocurrent is highly dependent on the electric field strength which suggests that the phenomenon is not an electrochemical origin. Another study of optical properties is the synthesis of fluorene-containing benzoxazines [402]. Fluorene groups are known to exhibit photoluminescence.

Volume 4 presents a survey of optical systems, based on the principles of image formation, optical system setup and quality control which are covered by the first three volumes. Starting with the human eye, the chapters discuss all systems, from telescopes and binoculars to projection, spectroscopic and illumination systems.
