of sharing data. Computer networks are built with a combination of hardware and software. Information in this article focuses on wireless networking and computer networks, which are related to, but different than, social networking.

What Is a Computer Network?

The Internet is the global system of interconnected computer networks that uses the Internet protocol suite (TCP/IP) to communicate between networks and devices.

Internet - Wikipedia

TCP/IP was originally developed for Unix networks and is the protocol of the Internet and most local-area networks. Ethernet is a low-level protocol that spells out the electrical characteristics of the network hardware used by most local-area networks.

which we get after merging two technologies that are computer and communication. As a result, this combination of computer and network ends up in giving an integrated system that transmits all forms of data and information. It lacks differentiating data communications and data processing.

Difference between Network and Internet

A network is a collection of computers and devices connected together, often wirelessly, via communications devices and transmission media. When a computer connects to a network, it is online. Networks allow computers to share resources, such as hardware, software, data, and information. Sharing resources saves time and money.
