Abstract. Let (x, z) be a pair of observable random vectors. We construct a new “smoothed ” empirical likelihood-based test for the hypothesis $E\{g(z, \theta)|x\} = 0$ w.p.1, where g is a vector of known functions and θ an unknown finite-dimensional parameter.

In real game problems not all players can cooperate directly, games with communication structures introduced by Myerson in 1977 can deal with these problems quite well. More recently, this concept has been introduced into fuzzy games. In this paper, games on (fuzzy) communication structures were studied. We proved that if a coalitional game has a nonempty core, then the game restricted on an n ...

Abstract. In sequential change detection, existing performance measures differ significantly in the way they treat the time of change. By modeling this quantity as a random time, we introduce a general framework capable of capturing and better understanding most well-known criteria and also propose new ones.
