the vent pipe. Some anode systems are designed such that all of the anodes are to be connected to the vent pipe during installation. The cables to any anodes that are installed with the vent pipe should be secured to the vent pipe (with electrical tape or like material) to help insure that they are not damaged in the process.

Once the design current output of the deep anode system has been determined, it is necessary to investigate the geology at the proposed installation location. With knowledge of the subsurface soils, the design engineer can estimate the depth of completion, determine the required hole diameter, and select the proper casing size and active length.

1. Anodes and Installation: MMO tabular anodes in a vertical well to depths of 20–35 meter. 2. Current Effectiveness: 95% to 98% current being applied to incidental structures; only 2 to 5% of the current actually going to the piping systems. 3. Shielding / Current Distribution: Piping in close proximity to RCC foundations and earthed structures

Design and Installation Aspects of Cathodic Protection

Deep well anode installations are used to reduce interference effects or to reach low resistivity soil. Anode lead wires should never be used to suspend, carry, or install anode.

Basic Design Tips - Use Quality Anodes: Aluminum Anodes - More than 95% of au anodes used in deep water CP systems are Aluminum (Al) alloyed with zinc (Zn) and Indium (In). This gives us the Indium activated Aluminum anode. This alloy was developed in the 70’s and is the preferred anode for deep water applications for the following reasons:

Design and Application of Deep Water CP Systems (Paper)

A typical Deep Well Anode System consists of drilling a 10 inch diameter hole between 200 and 900 feet deep. The depth is determined by the geological formations found in the area of the installation. Once the hole is completed, an electrical resistance log is recorded from the bottom to the top of the hole.

Remove the deep anode groundbed surface materials, including the surface casing. The first step in the process is to safely de-energize and remove any electrical equipment such as AC power cabling, transformer/rectifiers, junction boxes and cabling. The surface casing and hole plug should then be removed. Drill into the old groundbed borehole.
