Seems like this effectively creates an open plenum top feeding a lower divided plenum intake - sort of like a tunnel ram does, with obviously less volume and shorter runner lengths. So my guess is this probably increases the hi-rpm power and bumps the effective RPM range of the intake from idle-5400 (stock) to something in the 1200-5800 range.

Re-jet accordingly and investigate timing reduction based on potential improvement to mixture quality. Check runner and plenum surface texture and re-texture any areas that have been ground or polished (if rules permit). If you identify runner discrepancies, consider using plenum floor dams or slots to redirect flow.
